

New operating theatre at the Central Military Hospital Prague

In February 2008, the Central Military Hospital in Prague opened its new multifunctional operating room with magnetic resonance imaging for neurosurgical interventions.

This unique facility enables the surgeon to visualise the affected brain tissue to be removed with millimetre-high resolution. During the surgery, the system enables the staff to transfer the patient directly with the operating table on rails to the adjacent room equipped with magnetic resonance imaging device, which is able to distinguish every detail of the affected tissue and to determine further surgical procedure with the help of the most sophisticated technology.

The multifunctional operating room at the Central Military Hospital is a unique unit of its kind. There are only two similar facilities worldwide, namely in Belgium and USA.
